Let's talk about Computer science in general.\n\nYes, if I was[1] to get a computer that worked at all on every aspect of your life, it would have to be this thing that you write code for and[2] someone else would actually[3] do the actual work, right? \n\nWell, they can't, because you can't program a computer. Because there isn't any algorithm that works in a vacuum.[4] It takes hours of thinking to figure out how to do something, so[5] an algorithm won't work.\n\nThat's what drives everyone in Silicon Valley crazy.\n\nYeah, definitely.[6] It's also why every one of these technologies are[7] still in development now and why nobody has time to work on anything anymore.[8] You can't[9] ever make something work on[10] any aspect of your life,[11] because you're constantly reinventing yourself, and there's no way for you to keep up.\n\nDo you think that it[12] would be a lot easier to make a computer that runs in a programming language? For an engineer who doesn't really[13] understand programming but wants to learn it.[14]\n\nWell, if you're trying to do something that requires a computer to do math,[15] you're going to do everything on a computer. If you're trying to be an engineer who wants to be a scientist, you're going to use a computer to do calculations to prove things that you just[16] don't understand when you're trying to prove something that doesn't require data to solve for.[17,18] Even[19] just for some of the things.[20] So, I don't think it'd be much of a problem for people to use a computer to do that.[21] I mean, how would they know that they needed a computer for the things they were doing, what[22] was the right thing to do in this case? I mean, it'd be hard to prove otherwise.\n\nAs far as the future of computer science itself?\n\nWe're always trying, especially in the computer science world. But that's not why it gets called computer science. This[23] is called mathematics. We've always, for a long

time, been working[24] in mathematics of all kinds. This[25] is why I said the math[26] is not computer science. Math is the language of the human mind.\n\nDo you mean for mathematics, or for[27] computational complexity and algorithms etc[28]? \n\nI think for everything that's in mathematics,[29] mathematics is the language of the human mind. So, for anything that's[30] complex[31] you have a mathematical language. And this is
